

Dermacase

Can you identify this condition?

Amanda N. Webb Richard G.B. Langley MD FRCP
Todd F. Hatchette MD FRCP

A 22-year-old homosexual man presented to a family medicine clinic with a 3- to 4-month history of a blanching, erythematous eruption involving 80% of his arms and trunk, and progressively painful, well-defined, scaling papules and plaques on his palms and the plantar surfaces of his feet. He also had marked lymphadenopathy in the submandibular region and complained of a sore throat and malaise. He was initially referred to an otolaryngologist, who performed a fine-needle aspiration of 4 lymph nodes. The patient was also referred to a dermatologist, who performed a skin biopsy and diagnostic testing.

The most likely diagnosis is

1. Psoriasis
2. Pityriasis rosea
3. Sarcoidosis
4. Secondary syphilis
5. Drug eruption

Ophthaprobem

Can you identify this condition?

Khaliq Kurji MSc Karim Damji MD FRCS MBA

A 1-month-old baby is brought to the clinic by her parents for a well-baby visit. The child was born at full term. The mother's pregnancy was unremarkable, and her delivery was uncomplicated.

In the clinic, the child appears healthy overall. However, the parents have noted that, since birth, her eyes have become quite large, tear frequently, and the corneas appear cloudy. An examination confirms the large eyes, bilateral cloudy corneas, and tearing. The child also exhibits sensitivity to light.

The most likely diagnosis is

1. Sclerocornea
2. Birth trauma
3. Primary congenital glaucoma
4. Corneal ulcer
