

Ophthalmopproblem

Todd Urton Sanjay Sharma, MD, MSC, FRCSC, MBA

.....

A 21-year-old patient presented with painless gradual blurring of vision in both eyes. The blurring had occurred over the last 8 months. During that time she had required two changes in the strength of her glasses and now found her vision had again become blurred. Her visual acuity was 6/15 in her right eye and 6/9 in her left eye.

The appearance of the eye is compatible with the patient's having which of the following?

1. Lattice corneal dystrophy
2. Band keratopathy
3. Arcus senilis
4. Keratoconus
