

DermaCase

Patricia Ting, MSC, MD Benjamin Barankin, MD, FRCPC

CAN YOU IDENTIFY THIS CONDITION?

A 37-year-old woman presented with multiple atrophic patches on both legs. The patches, which were asymptomatic, had a “cigarette paper” appearance. They had appeared gradually over a number of years. She had a history of pyoderma gangrenosum that had been treated for several years with topical corticosteroids.

The most likely diagnosis is:

1. Mycosis fungoides
2. Anetoderma
3. Corticosteroid-induced atrophy
4. Localized lipodystrophy
5. Cutis laxa

Answer on page 1551

Dr Ting is a recent graduate of the University of Calgary Medical School in Alberta. **Dr Barankin** is a dermatologist in Toronto, Ont.
