

Can you identify this condition?

Rob Lacroix Mike Kalisiak MD Jaggi Rao MD FRCPC

A young female patient presents with a chronic large, waxy, yellowish-red lesion on her lower extremity, characterized by telangiectases, central atrophy, and several ulcerations. It has persisted for several years and various creams have been only minimally successful. She has a history of type 1 diabetes mellitus but is otherwise healthy.

The most likely diagnosis is

1. Granuloma annulare
2. Necrobiosis lipoidica
3. Necrobiotic xanthogranuloma
4. Sarcoidosis
5. Erythema nodosum
