

Dermacase

Can you identify this condition?

Catherine Ho Peng Yan Nisha Mistry MD
Chih-ho Hong MD FRCP

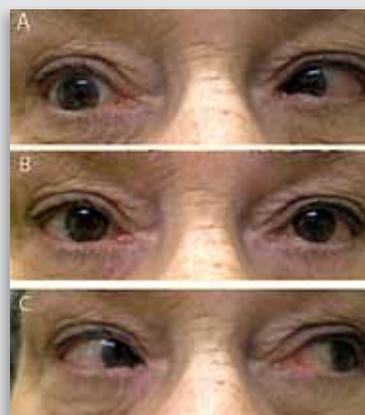

A 44-year-old man presents with a 5-year history of an asymptomatic, progressive, bilateral cutaneous eruption involving the medial aspects of his lower extremities. Physical examination reveals orange-brown irregular patches on the medial aspects of the lower legs, with nonpalpable pinpoint puncta resembling grains of cayenne pepper.

The most likely diagnosis is

1. Purpuric contact dermatitis
2. Early mycosis fungoides
3. Stasis dermatitis
4. Progressive pigmented purpuric dermatosis
5. Leukocytoclastic vasculitis

Ophthalmoproblem

Can you identify this condition?

Stephanie C.Y. Chan Joshua C. Teichman MD
Amadeo R. Rodriguez MD

A 64-year-old woman with a past medical history of type 2 diabetes mellitus, hypertension, dyslipidemia, depression, and osteoporosis presents with a 2-week history of binocular horizontal diplopia. Her past ocular history includes diabetic retinopathy and cataract extraction. She admits to a 75-pack-year smoking history. She has no other neurologic symptoms and no history of cancer. On examination, visual acuity, pupillary testing, intraocular pressure, and slit-lamp examination results are all within normal limits. Fundus examination reveals nonproliferative diabetic retinopathy. Extraocular muscle testing reveals the above images.

The most likely diagnosis is

1. Oculomotor nerve palsy secondary to microvascular ischemia
2. Oculomotor nerve palsy secondary to intracranial mass lesion
3. Abducent nerve palsy secondary to microvascular ischemia
4. Abducent nerve palsy secondary to intracranial mass lesion
