

Dermacase

Can you identify this condition?

W.E. Osmun MD MCISc CCFP Jennifer Parr MD CCFP

An 88-year-old farmer presented with a slow-growing lesion on the left side of his neck, which had been there for years but only recently began to grow. He also complained it was itchy.

The most likely diagnosis is

1. Dermatitis
2. Actinic keratosis
3. Psoriasis
4. Bowen disease
5. Basal cell carcinoma

Dermacase

Can you identify this condition?

Manuel Gil-Mosquera MD Sergio Vano-Galvan MD
Ruth Gomez-Guerra MD Pedro Jaen MD PhD

A 31-year-old woman presented with asymptomatic, erythematous, cutaneous lesions on her back. The rash began 2 months before and was neither pruritic nor painful. She denied arthralgia, fever, or other symptoms. The patient had a long history of arthritis and back pain. On physical examination, there was a well-defined, brown, erythematous, and reticular patch that occupied the entire lower back. Complete blood count, routine urinalysis results, liver and renal function, serum glucose and electrolyte levels, and erythrocyte sedimentation rate were all within normal limits.

The most likely diagnosis is

1. Acanthosis nigricans
2. Livedo reticularis
3. Erythema ab igne
4. Systemic lupus erythematosus
5. Livedo vasculitis
