

Dermacase

Can you identify this condition?

Lina Abdullah RN Ossama Abbas MD

A 37-year-old woman presented with a 5-month history of asymptomatic, progressively increasing skin lesions on the right side of her face. Skin examination revealed red to violaceous indurated papules and plaques over the right cheek. No other abnormality was present on physical examination. The patient was otherwise healthy, was not taking any medications, and had no family history of a similar condition.

The most likely diagnosis is

1. Rosacea
2. Granuloma faciale
3. Lupus erythematosus
4. Sarcoidosis

Ophthalmoprobem

Can you identify this condition?

Davin Johnson MD Kelly Schweitzer MD
Martin ten Hove MD Sanjay Sharma MD MSc MBA FRCSC

A 17-year-old boy presents with a tennis ball injury to the right eye, which occurred 6 hours earlier during a game of road hockey. He complains of severe pain in and around the eye, as well as blurred vision and photophobia. He is otherwise healthy. On examination, visual acuity is 6/30 in the right eye and 6/6 in the left eye. Extraocular movements, confrontation visual fields, and pupillary responses are normal. Tonometry reveals intraocular pressures of 35 mm Hg in the right eye and 11 mm Hg in the left eye. Anterior segment examination of the right eye reveals the image above.

The most likely diagnosis is

1. Hypopyon
2. Hyphema
3. Acute angle-closure glaucoma
4. Subconjunctival hemorrhage
